

ABSTRACT OF THE DISCLOSURE

A rack comprises feed rollers, sidewall members, a base member, a top wall member, a bottom plate, guide members, and a grip. The inside of the top wall member is hollow, and filling liquid is loaded therein. A processing tank contains rinsing solution. The rack gets snagged on the upper end of the processing tank. Since the filling liquid increases the total weight of the rack, the rack is prevented from floating in the processing tank by buoyant force.
